

ABSTRACT OF DISCLOSURE

A process for making at least one digital image available to a user on a server after processing of the image. In the process, based on a telephone call or a mobile Internet session in which the user sends a code identifying at least one image they desire to have processed, a number is recovered uniquely identifying a terminal by way of which the user sent the code. The code identifying the image is associated with the number identifying the terminal. An address is defined on the server by integrating the number identifying the terminal. Further, at the address, at least one image is stored on the server after processing.
